SITES IN THE CORPUS

Same engineers, same means — four grades apart

We ran the same grid over 1269 European data centers: 5 fundamental pillars — energy, water, land, local impact, transparency — and 22 targeted, sourced indicators per site. A grade from A to E, published with its documentation. Eighteen of those sites belong to Amazon, Google (Alphabet), Meta and Microsoft.

And here is the riddle. The same group — same teams, same standards — owns a site rated B in Finland and a site rated E in Belgium. Four grades apart under a single brand. None of the four groups is homogeneous.

Three suspects come to mind — the power grid, size, water. We questioned them one by one, evidence in hand.
